**"MICROBIAL AND MEIOFAUNAL COMMUNITIES
OF BEACH ECOSYSTEM IN THE MAREMMA
REGIONAL PARK (ITALY)"**

**Mauro Fabiano, Simone Farina, Valentina Marin,
Mariapaola Moreno, Vanessa-Sarah Salvo**

Aims of the study:

- The assessment of the abundance, distribution and diversity of micro and meiobenthic communities in the Maremma sandy beach ecosystem
- The investigation of the trophodynamic features and the main environmental variables affecting abundance, distribution and diversity of these communities.

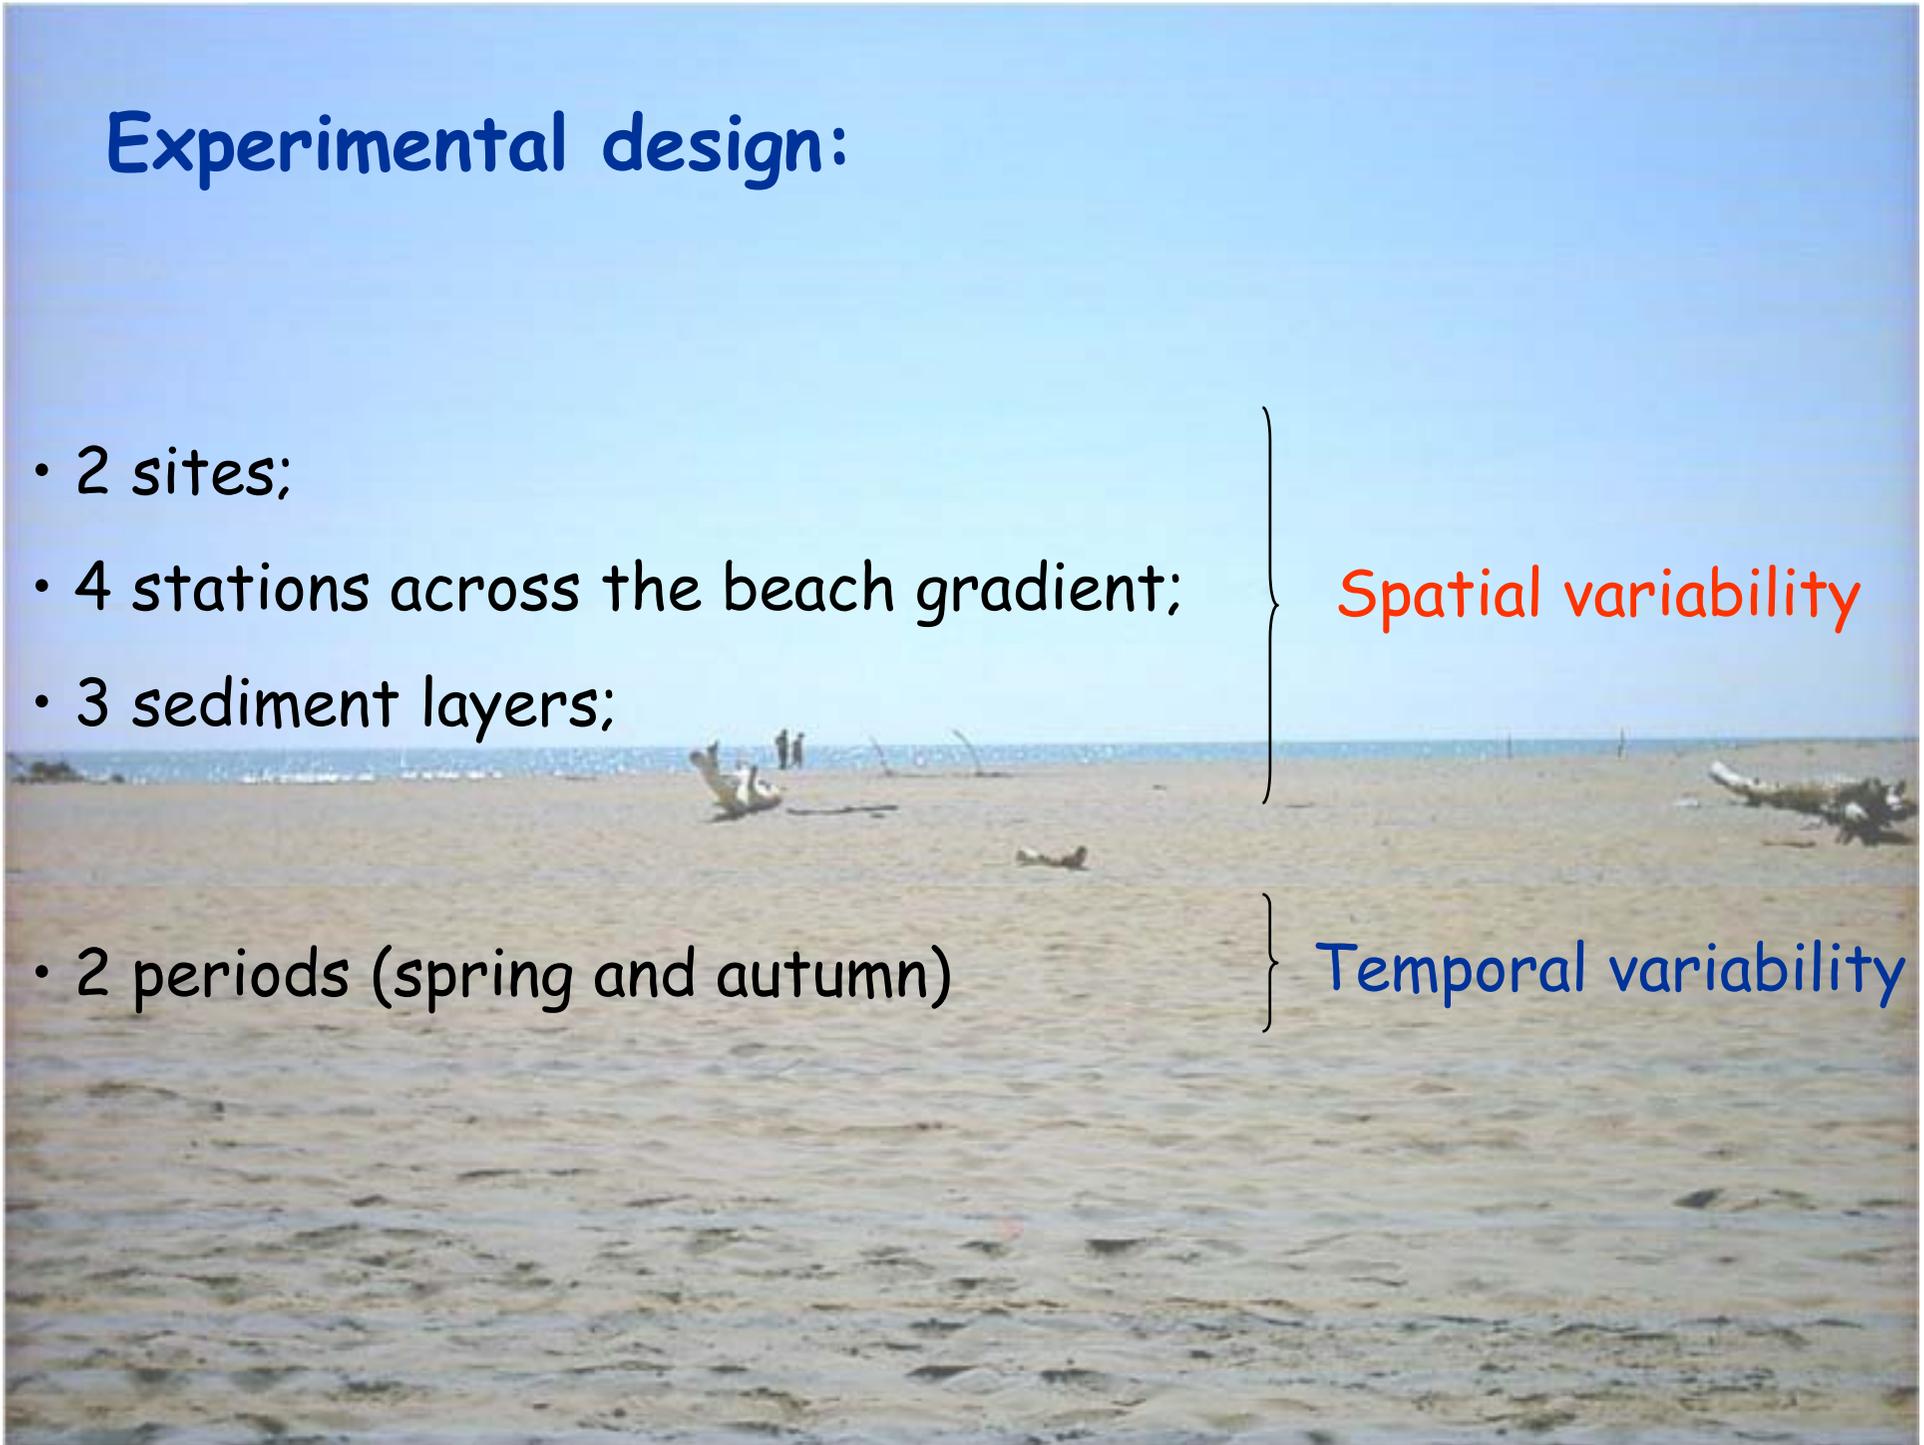

Experimental design:

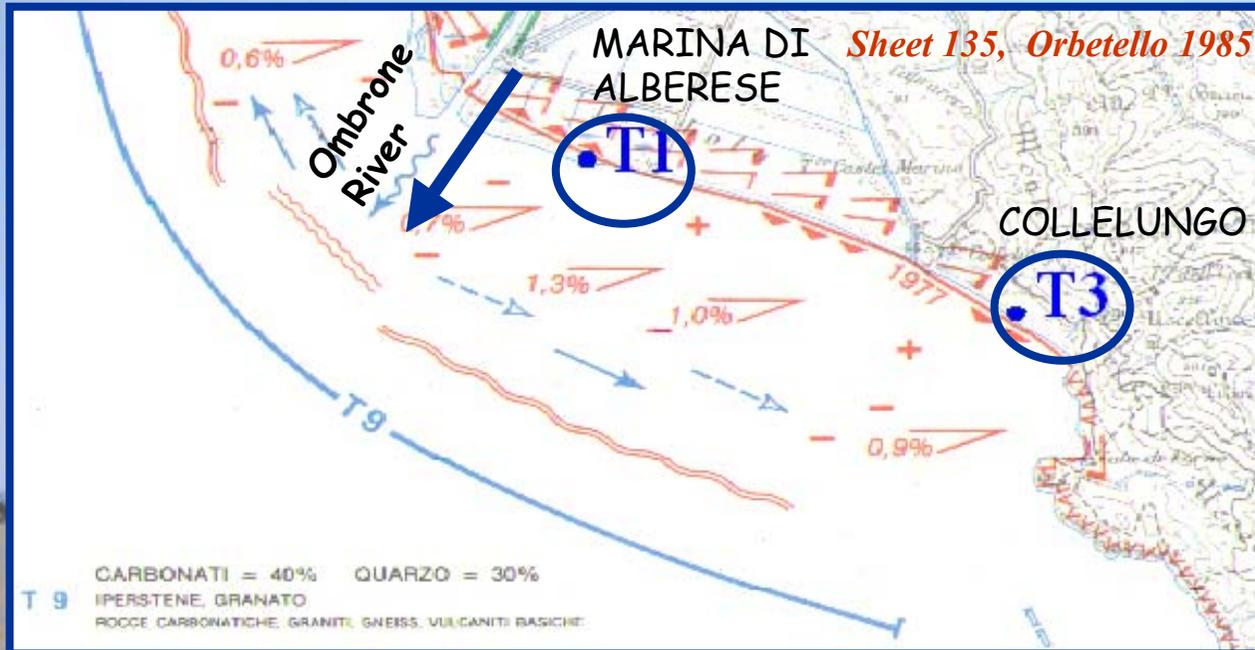

- 2 sites;
- 4 stations across the beach gradient;
- 3 sediment layers;
- 2 periods (spring and autumn)

Spatial variability

Temporal variability

Investigated sites

Maremma
Regional Park

Geomorphological characteristics: shore slope 1%, length 7 Km

Microtidal beaches: mean tidal excursions from 20 to 30 cm

EXPOSED beaches (exposure rate=12)

Marina di Alberese (T1) → **erosion**

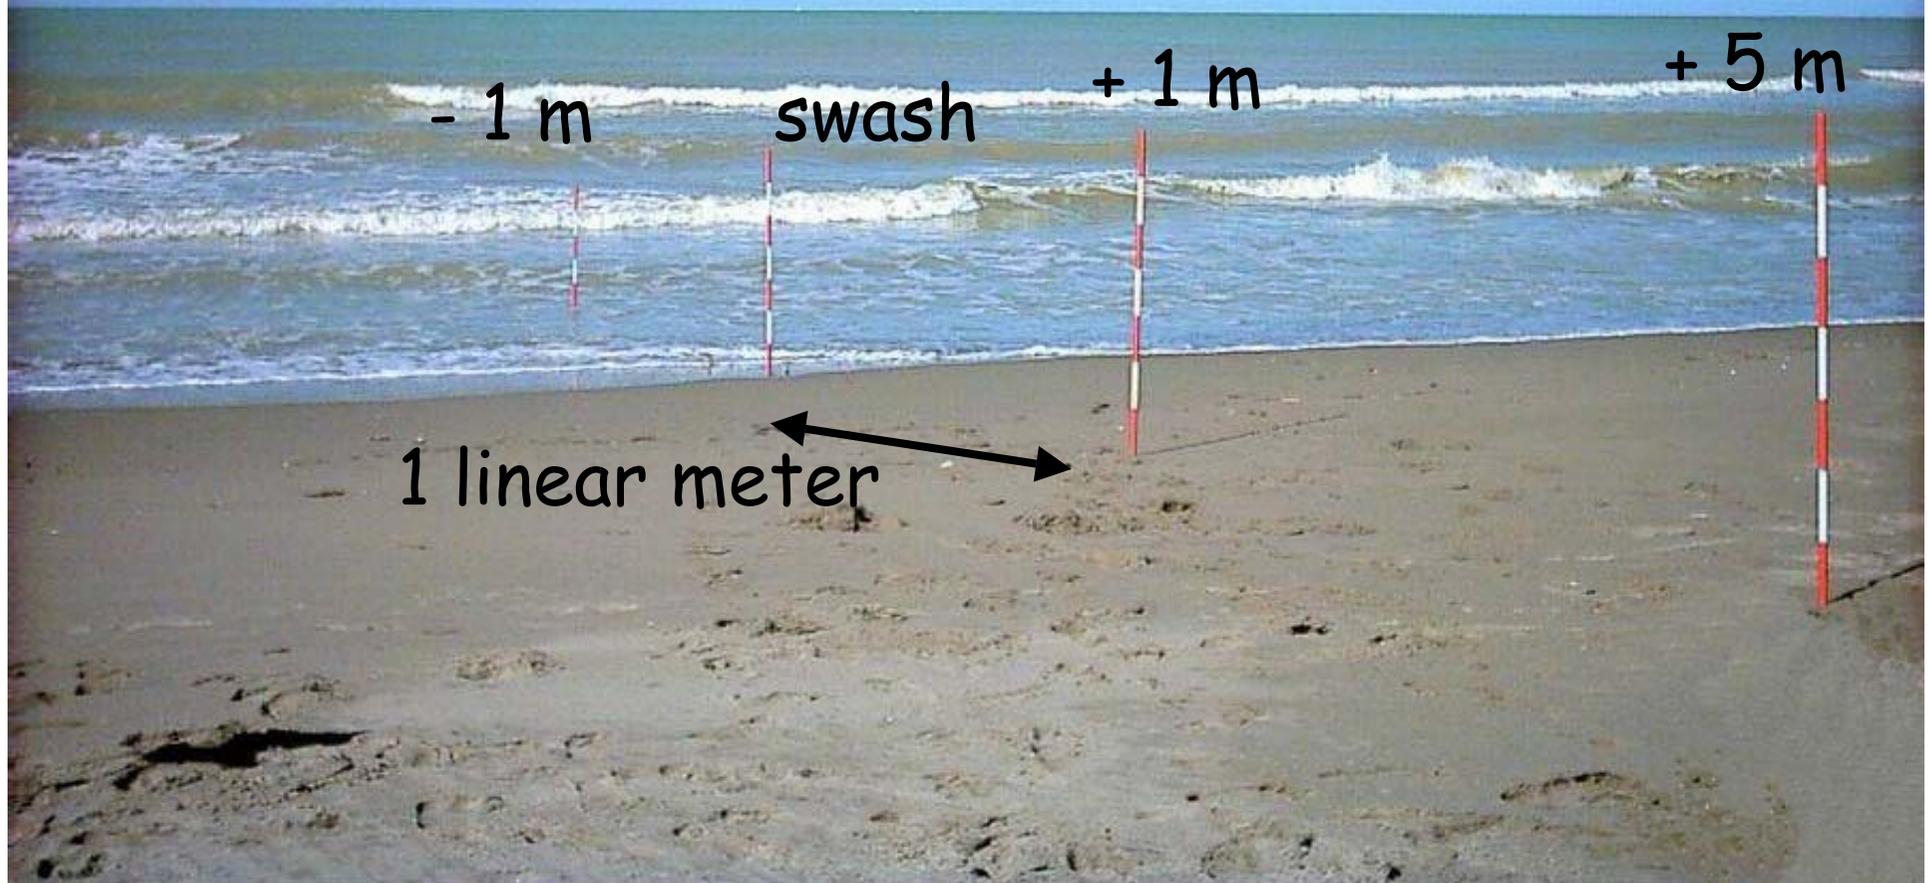

Collelungo (T3) → **accretion**

Marques *et al.*, (2003)

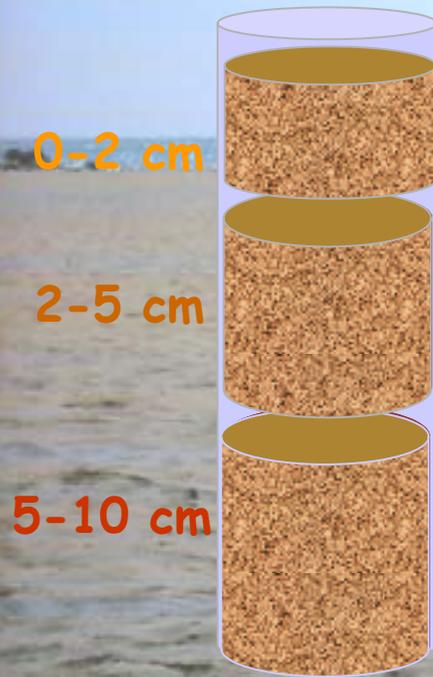

Atlas of the Italian Beaches
(AA.VV., 1999)

Across beach gradient (stations):

Horizontal distribution of the stations across the beach
(linear meter distance from the swash zone)

Sampling:

Physical and biochemical variables

- Eh
- Grain size
- Organic matter (Prt and Cho)

Biological Communities

- Bacteria (density and biomass)
 - Meiofauna (density and diversity)
 - Microphytobenthos (density and diversity)
 - Fungi (density and diversity)
- } 0-2 cm

Sediment characteristics:

Eh: 385-443 mV

Homogeneous vertical distribution

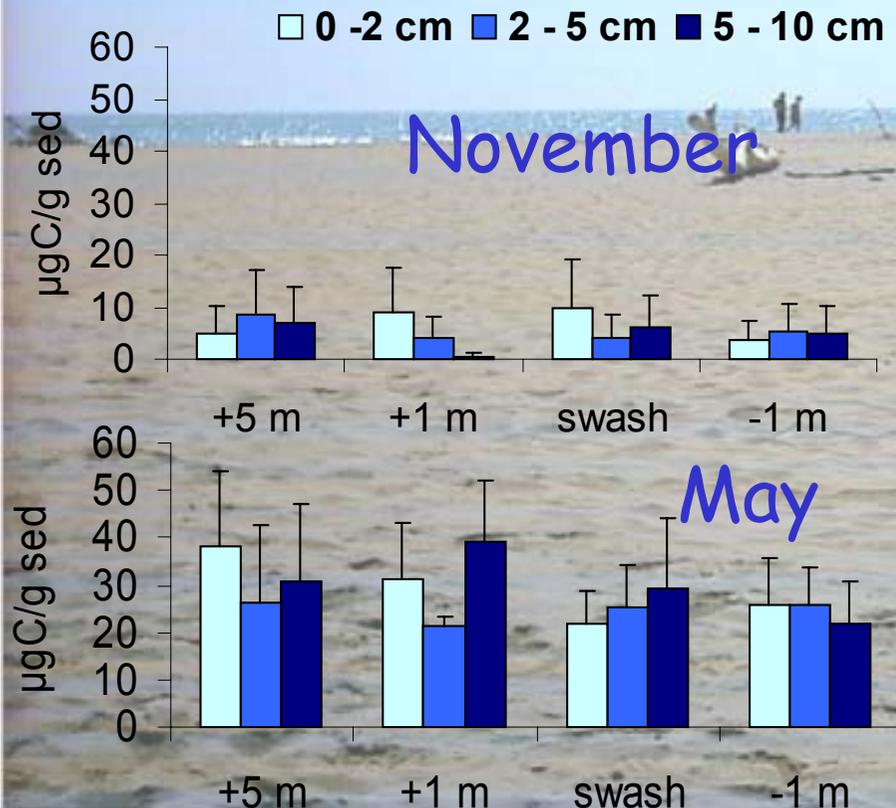

Grain size: \varnothing 0.3-0.5 mm

Medium sand

(Udden & Wentworth scale)

Finer grain size in the swash zone

Organic matter (CPrt+CCho $\mu\text{gC/g}$ sed DW):

- low concentrations (mediterranean shallow sediments: 100-3000 $\mu\text{gC/g}$)
- no significant spatial variation (Anova, ns)
- significant temporal variation (Anova, $p < 0.05$)

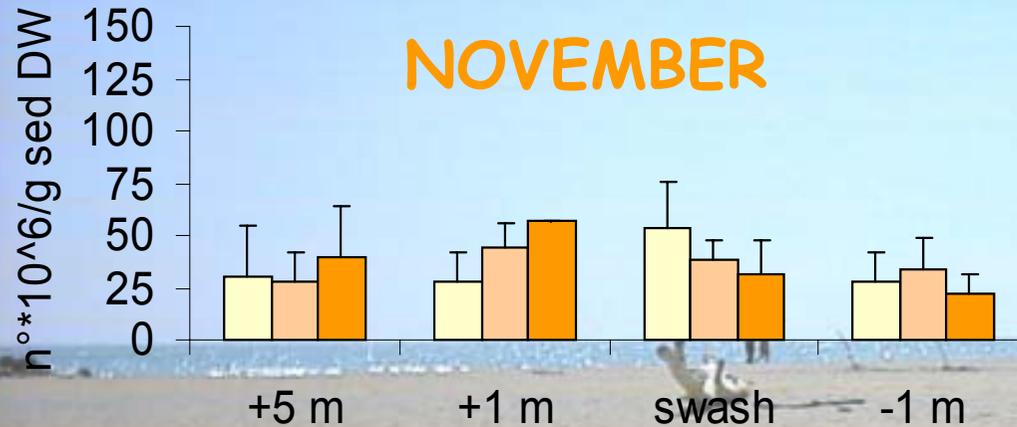

BACTERIAL DENSITY

TBN cellx10⁶/g sed DW

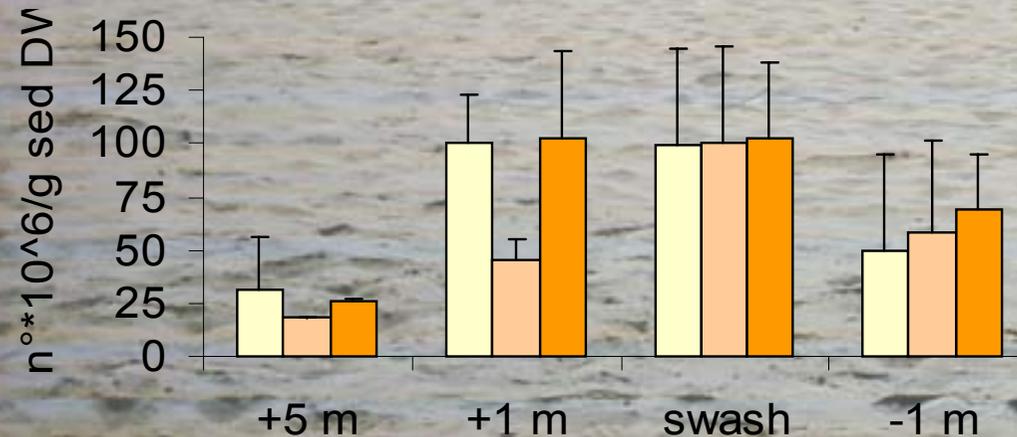

0-2 cm 2-5 cm 5-10 cm

NOVEMBER

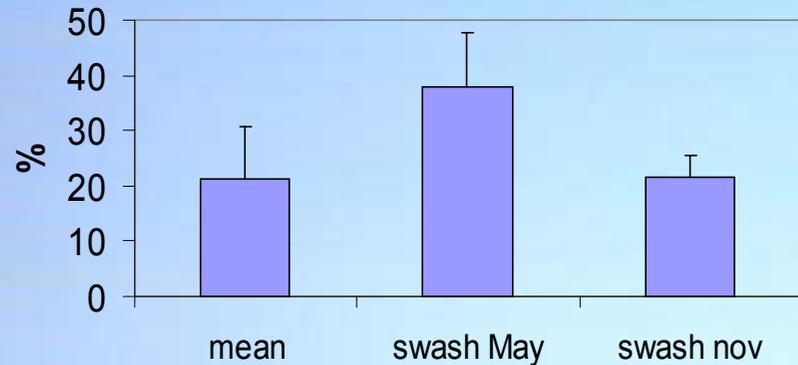

MAY

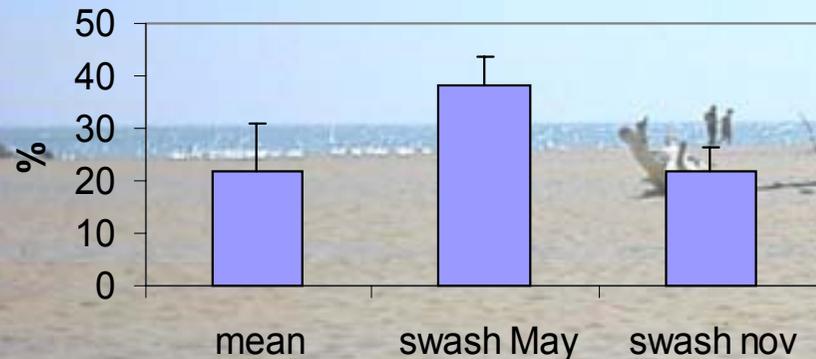

- low densities (mediterranean shallow sediments: 0.75-200*10⁸ cells/g sed DW)
- significant spatial variation (Anova, p<0.05) → max in the swash zone
- increasing in May

Trophodynamic features:

% of Bacterial N to total protein N

% of Bacterial C to total prt and cho C

Chl-a concentrations and microphytobenthos densities were very low.

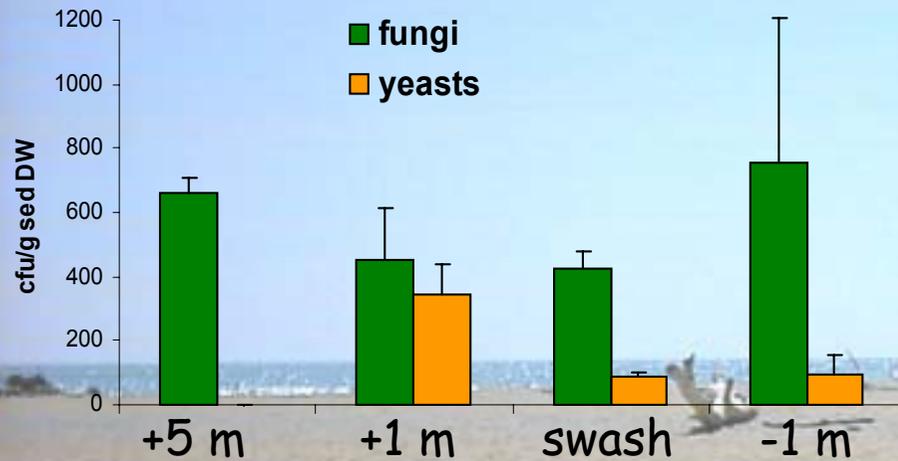

Heterotrophic system

FUNGAL DENSITY

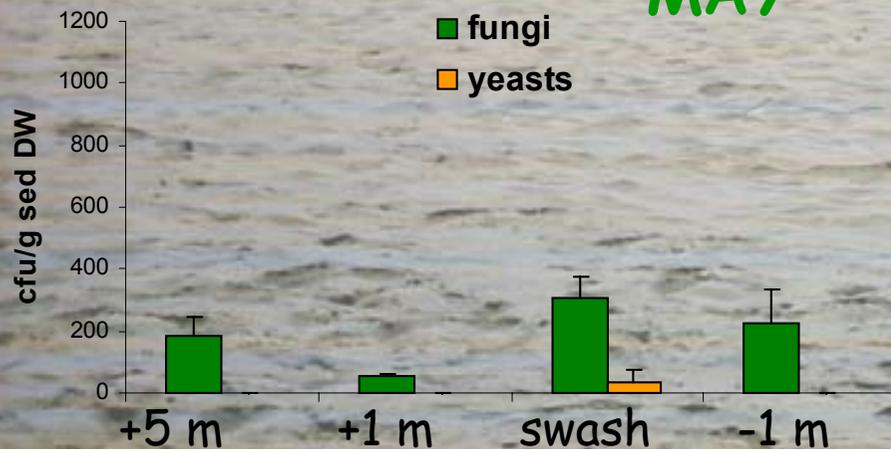

CFU/g sed DW

Marina di Alberese

NOVEMBER

MAY

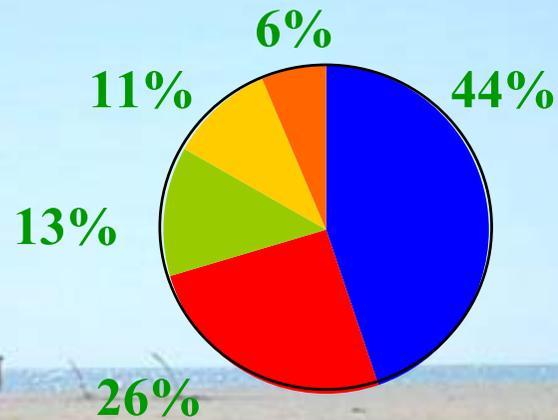

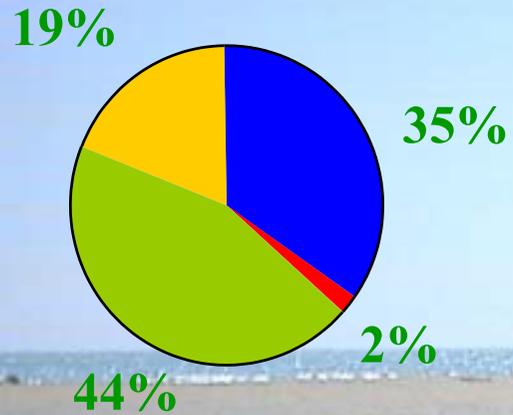

- Not significant spatial differences in density (ANOVA, ns)
- Significant Temporal differences (ANOVA, $p < 0.05$)

FUNGAL DIVERSITY

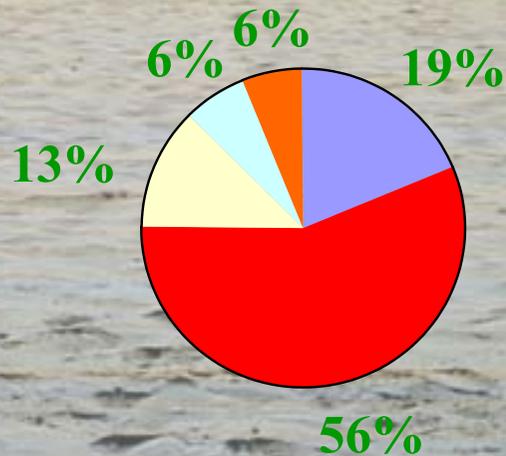

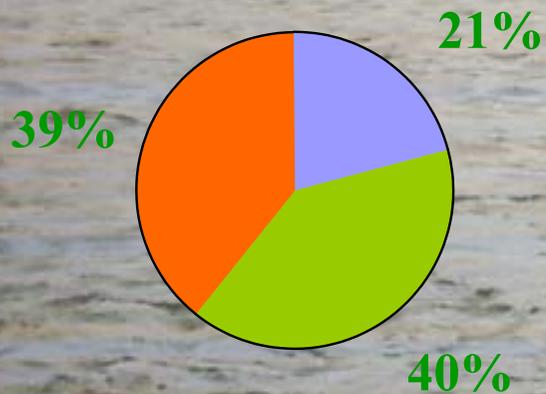

Marina di Alberese

Collelungo

November

May

- *Penicillium spp.*
- *Cladosporium spp.*
- *Trichoderma spp.*
- *Chaetomium spp.*
- *Papulaspora halima*

- *Trichoderma spp.*
- *Phoma spp.*
- *Cladosporium spp.*
- *Pericornia spp.*
- *Zopfiella spp.*
- *Papulaspora halima*

MICROPHYTOBENTHOS DENSITY

cell of diatoms/g sed DW

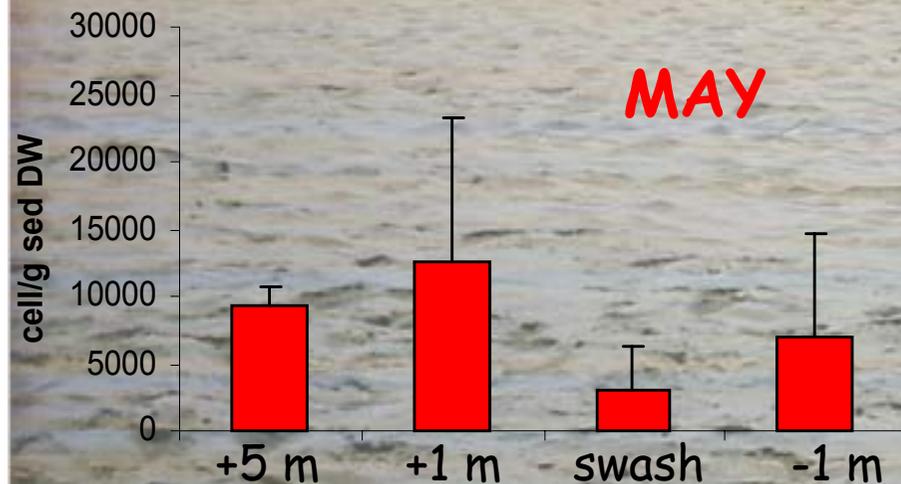

NOVEMBER

Chl-a concentrations \rightarrow 0 - 0.1 $\mu\text{g/g}$

• Low Chl-a concentrations and microphytobenthos densities (Ligurian beaches and 0.04 $\mu\text{g/g}$; mediterranean shallow sediments 3.27 $\mu\text{g/g}$)

MAY

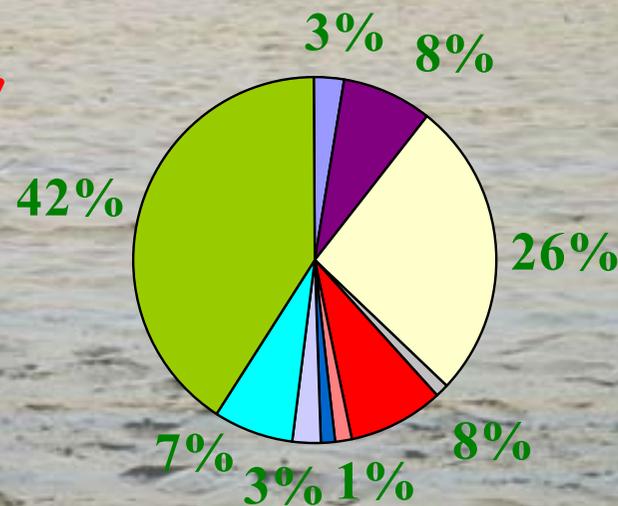

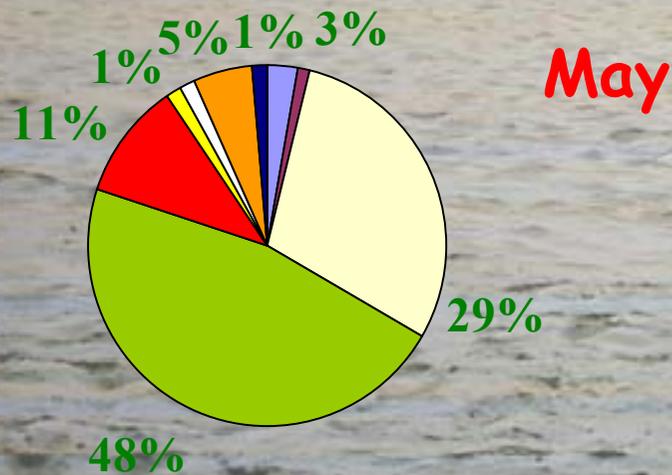

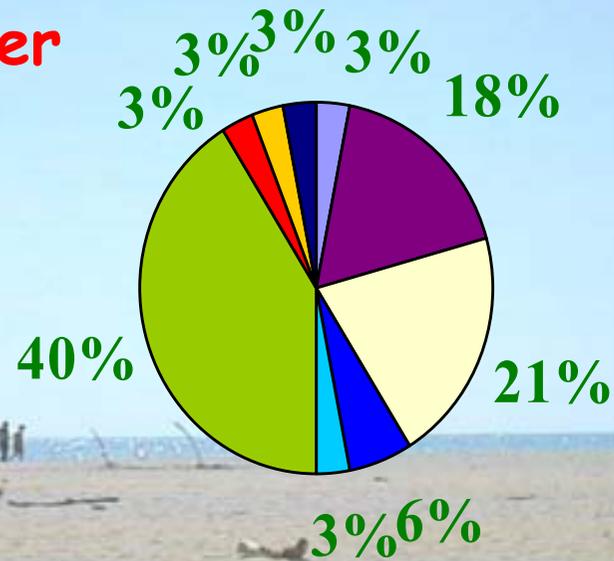

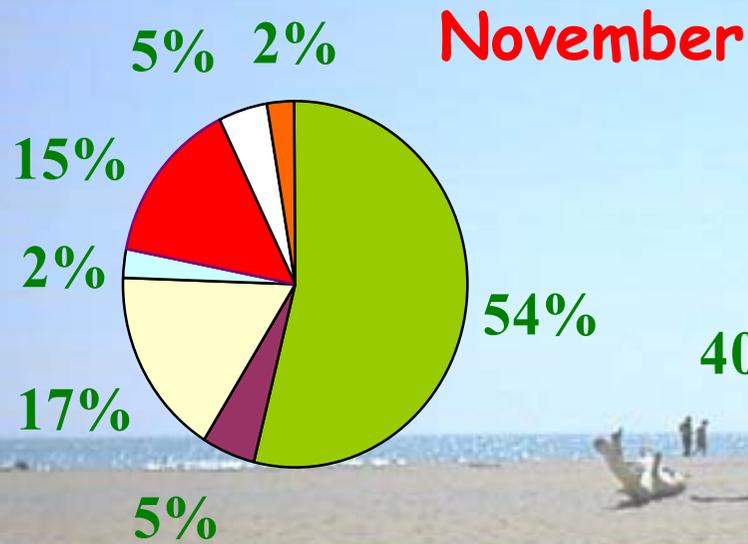

• Not significant Spatial and Temporal differences in density (ANOVA, ns)

MICROPHYTOBENTHOS DIVERSITY

Marina di Alberese

Collelungo

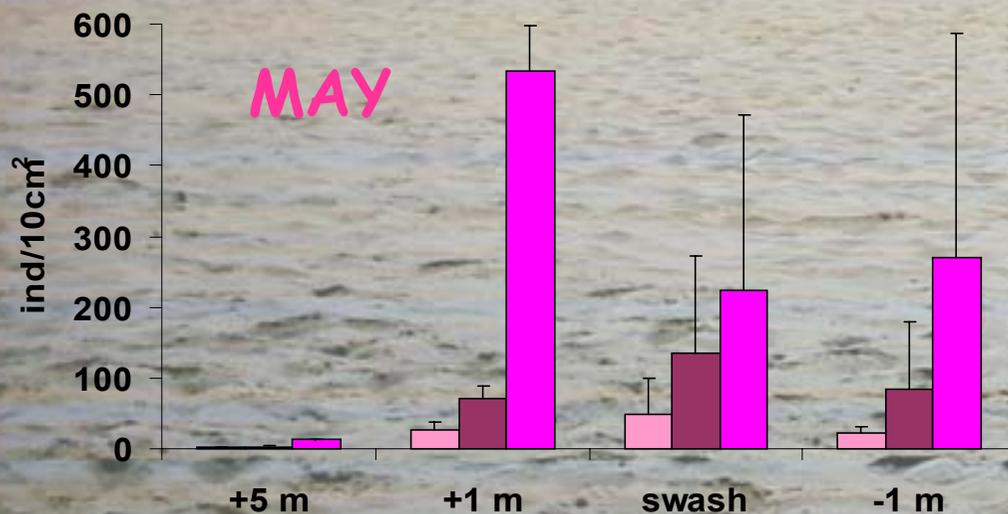

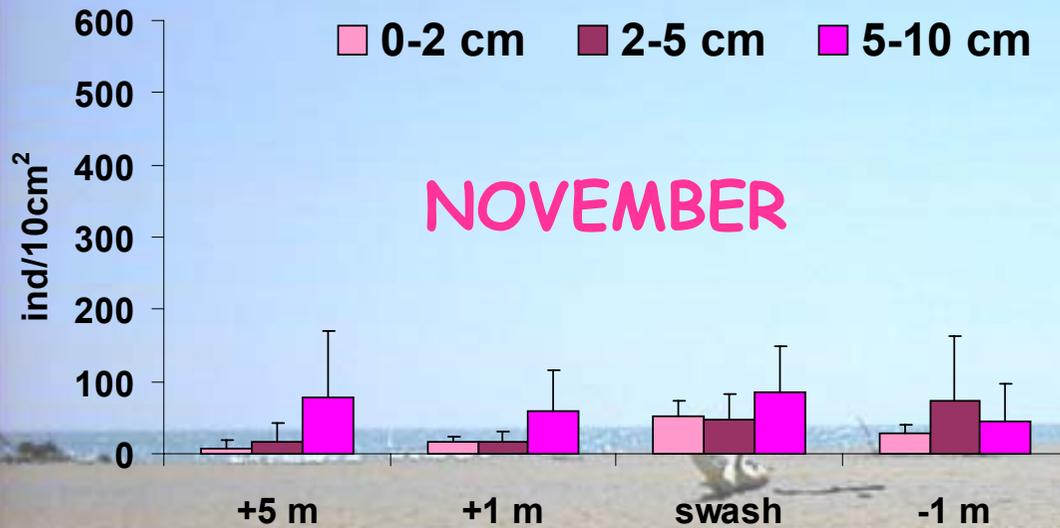

- *Rhabdonema spp*
- *Pleurosigma spp*
- *Amphora spp*
- *Navicula spp*,
- *Cocconeis spp*
- *Nitzschia spp*
- *Stauriosira spp.*
- *Coscinodiscus spp*,
- *Licmophora spp*
- *Biddulphia spp*

- *Amphiprora spp*
- *Mastogloia spp*
- *Thalassionema spp.*
- *Fragilaria spp*
- *Gramatophora spp*
- *Synedra spp*
- *Thalassiosira spp*

MEIOFAUNA DENSITY

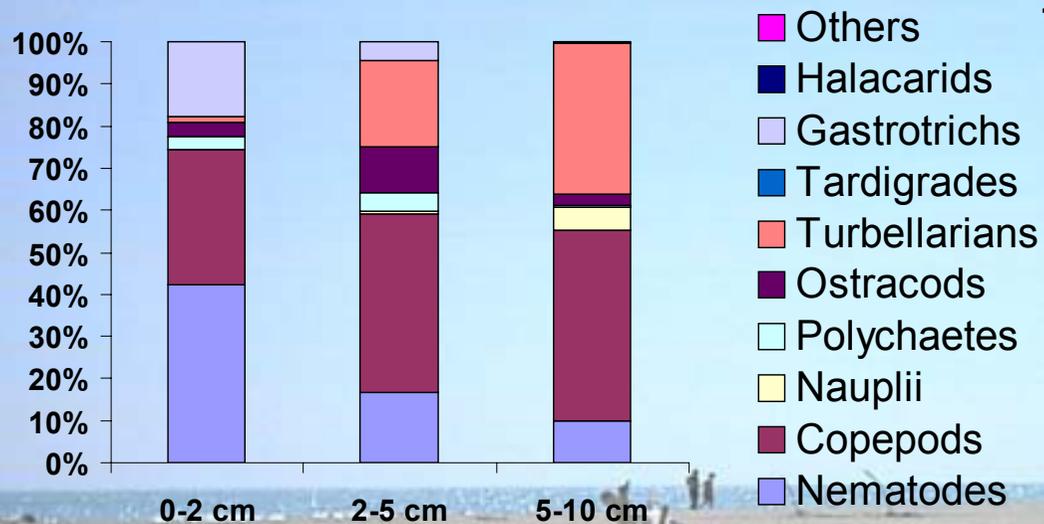

ind/10 cm²

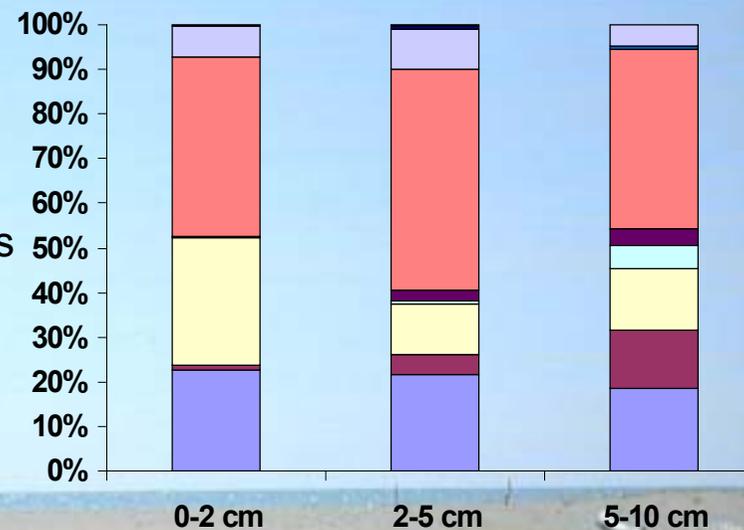

- low densities (mediterranean shallow sediments: 200-3000 ind/10cm²)
- similar densities of other sandy beach : 50-1500 ind/10cm² (McIntyre, 1969)
- vertical distribution with maximum in the deep layer
- increasing in May

MEIOFAUNA DIVERSITY

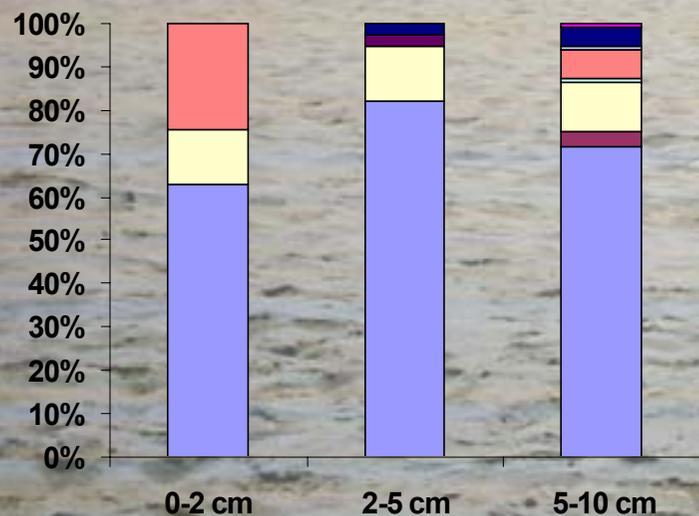

+5 m Nov

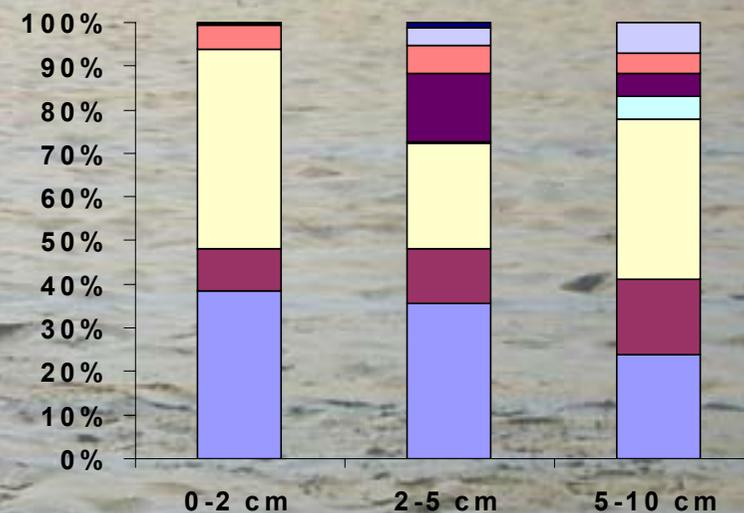

swash Nov

+5 m May

swash May

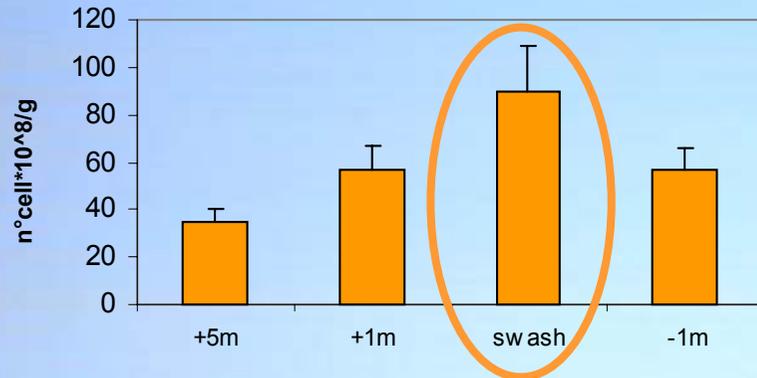

Relationships MEIOFAUNA-ENVIRONMENTAL VARIABLES (Moreno et al., 2005, Estuar Coast Shelf S, in press)

No. Vars	Corr.	Selections
3	0,455	Dryness, Grain Size, BBM
2	0,432	Dryness, BBM
2	0,393	Grain Size, BBM
1	0,388	BBM
4	0,318	Dryness, Grain Size, Cho, BBM
3	0,311	Dryness, Cho, BBM
3	0,288	Grain Size, Cho, BBM
2	0,284	Cho, BBM
2	0,218	Dryness, Grain Size
1	0,196	Dryness

On the surface layer positive correlations were found between meiofauna and fungi, while negative correlations were found between meiofauna and microphytobenthos.

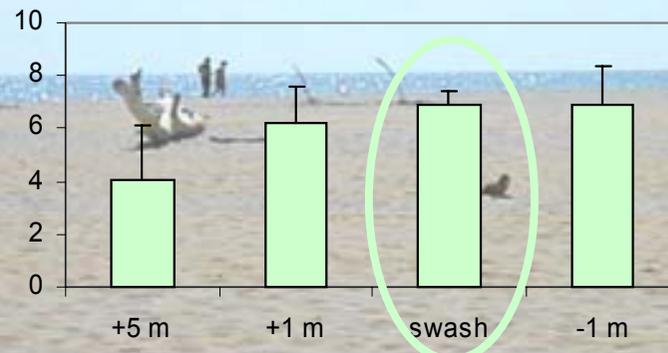

SPATIAL DISTRIBUTION: The role of the swash zone

TBN

MEIOFAUNA

Number of Taxa

- swash hydrodynamics determine interactions between marine and terrestrial processes
- high oxygenation and moisture content

CONCLUSIONS:

- Maremma beaches are strongly oligotrophic and heterotrophic system, (low microphytobenthos abundance, while bacteria made up to 30% of total biopolymeric C and N).
 - Microbial and meiofauna organisms showed low abundances and their distribution showed great variability across the beach gradient and periods.
 - Higher values of diversity were always found in Collelungo site for all communities, probably related to the reduce physical stress (accretion) and more pristine environmental conditions (more distance from the river input).
4. Preliminary results highlighted physical factors as the main variables explaining abundance distribution and biodiversity of micro and meiobenthic communities and the swash zone resulted a key area where optimal values of these variable were found.
